1. APRESENTAÇÃO

Este documento corresponde à Avaliação Funcional e Estrutural dos Pavimentos do Produto 3A - Estudos de Engenharia I das rodovias BR 116 entre as divisas dos estados de Minas Gerais / Rio de Janeiro e Minas Gerais / Bahia e BR 381 entre Belo Horizonte e Governador Valadares, objeto do Contrato OCS No. 265/2006 firmado entre a Fundação para o Desenvolvimento Tecnológico de Engenharia – FDTE e o Banco Nacional de Desenvolvimento Econômico e Social – BNDES.

A avaliação estrutural compreendeu o levantamento das deflexões com equipamento FWD conforme DNER-PRO 273/96. A avaliação funcional compreendeu os seguintes levantamentos:

- Cadastro das ocorrências ou defeitos superficiais e deformações nas trilhas de roda conforme Norma DNIT 006/2003-PRO;
- Estimativa de porcentagem de área com trincas classe FC-2 e FC-3;
- Medições da Irregularidade Longitudinal conforme DNER-PRO 182/94;
- Desnível entre a pista de rolamento e os acostamentos;
- Situação superficial dos acostamentos.

A seguir é apresentado o linear esquemático dos trechos em estudo da rodovia BR 040.

2. AVALIAÇÃO FUNCIONAL

2.1. Avaliação Objetiva da Superfície do Pavimento

O cadastramento dos defeitos dos pavimentos flexíveis foi efetuado com base no procedimento DNIT 006/2003-PRO, aplicando-se a terminologia de defeitos, definida pela norma rodoviária DNIT 005/2003-TER. Também foi feita uma estimativa das áreas da superfície dos pavimentos afetadas por trincas classe 2 e 3.

O levantamento abrangeu a avaliação dos acostamentos existentes, indicando se são pavimentados ou não, a existência ou não de desnível em relação à pista de rolamento, e seu estado atual.

A avaliação consiste na observação dos defeitos existentes em estações de ensaio com seis metros de extensão e largura igual à seção da faixa de rolamento e determinação das flechas, em milímetros, nas trilhas de roda externa e interna nas mesmas. Os seguintes tipos de defeitos são considerados na vistoria:

- Tipo 1 - Trincas Classe 1 (FC-1) – FI, TTC, TTL, TLC, TLL e TRR;
- Tipo 2 - Trincas Classe 2 (FC-2) – J e TB;
- Tipo 3 - Trincas Classe 3 (FC-3) – JE e TBE;
- Tipo 4 - Afundamento (ALP e ALT);
- Tipo 5 - Ondulação e Panelas (O e P);
- Tipo 6 - Exsudação (EX);
- Tipo 7 - Desgaste (D);
- Tipo 8 - Remendos (R).

As flechas nas trilhas de roda foram medidas em milímetros, em todas as estações de ensaio, tanto na trilha interna como na externa, utilizando treliça metálica.

As fichas contendo os resultados dos levantamentos de campo são apresentadas nos Anexos A (Tomos I, II e III da BR 116) e Anexo E (Tomos VII e VIII).

O Índice de Gravidade Global (IGG) é calculado por segmento homogêneo em função de pesos dados aos tipos de defeitos avaliados, da frequência relativa e das características da flecha na trilha de roda (representadas por sua média e variância).

A frequência relativa (Fr) é obtida por meio da fórmula:

$$Fr = \frac{Fax100}{n}$$

onde:

Fa = frequência absoluta, corresponde ao número de vezes em que a ocorrência foi verificada;

n = número de estações inventariadas.

Para cada uma das ocorrências inventariadas, foi calculado o Índice de Gravidade Individual (IGI), a partir da fórmula:

$$IGI = FrxFp$$

onde:

Fr = frequência relativa;

Fp = fator de ponderação, obtido de acordo com a Tabela 2.1.

Tabela 2.1. Relação de fatores de ponderação por tipo de defeito.

Tipo	Codificação de Ocorrências (conforme DNIT 005/2003-TER)	Fator de Ponderação
1	FC-1 (FI, TTC, TTL, TLC, TLL e TRR)	0,2
2	FC-2 (JA e BL)	0,5
3	FC-3 (JE e BE)	0,8
4	ALP e ATP	0,9
5	O e P	1,0
6	EX	0,5
7	D	0,3
8	R	0,6

Para a média aritmética e para as variâncias das flechas, o fator de ponderação utilizado obedeceu ao seguinte critério:

- Quando a média aritmética é igual ou inferior a 30, o fator de ponderação é igual a 4/3. Quando superior a 30, o Índice de Gravidade Individual é igual a 40;
- Quando a variância é igual ou inferior a 50, o fator de ponderação é igual a um; quando superior a 50, o Índice de Gravidade Individual é igual a 50.

Quando em uma mesma estação foram constatadas ocorrências tipos 1, 2 e 3, só se consideraram as do tipo 3, para o cálculo da frequência relativa em percentagem (*Fr*) e Índice de Gravidade Individual (*IGI*); do mesmo modo, quando foram verificadas ocorrências 1 e 2, só se consideraram as de tipo 2.

O Índice de Gravidade Global (*IGG*) foi obtido a partir da fórmula:

$$IGG = \sum IGI$$

onde:

$\sum IGI$ = somatório dos Índices de Gravidade Individuais, calculados de acordo com o estabelecido anteriormente.

Com a finalidade de conferir ao pavimento inventariado um conceito que retrate o grau de deterioração atingido, é definida a correspondência apresentada na Tabela 2.2 a seguir.

Tabela 2.2. Conceitos de degradação do pavimento em função do IGG.

Conceitos	Limites de IGG
Ótimo	$0 < \text{IGG} \leq 20$
Bom	$20 < \text{IGG} \leq 40$
Regular	$40 < \text{IGG} \leq 80$
Ruim	$80 < \text{IGG} \leq 160$
Péssimo	$\text{IGG} > 160$

O Anexo B (Tomo IV – BR 116 e Tomo IX – BR 381) contém as planilhas de cálculo do Índice de Gravidade Global (IGG) para cada quilômetro avaliado.

2.2. Irregularidade Longitudinal

A irregularidade longitudinal de um pavimento é uma característica que influi na interação a superfície da via com os veículos, gerando efeito sobre os próprios veículos, sobre os passageiros e o motorista e sobre a carga transportada. Ela é a grandeza física mensurável na superfície do pavimento que melhor se correlaciona com o custo operacional dos veículos, o conforto, a segurança, a velocidade e a economia das viagens.

A norma DNER-PRO 164/94 define a irregularidade como sendo o desvio da superfície da rodovia em relação a um plano de referência. Adota-se como escala padrão de irregularidade no Brasil o quociente de irregularidade - QI - expresso em contagens/km, porém, esta também pode ser expressa pelo IRI – *International Roughness Index* – dado em m/km ou mm/m. A relação usual utilizada para conversão é $IRI = \frac{QI}{13}$.

A medição da irregularidade, ou do quociente de irregularidade, foi realizada através do equipamento *Bump Integrator* devidamente calibrado, montado em um veículo utilitário. O *Bump Integrator* é um sistema Medidor de Irregularidade Tipo

Resposta (SMITR), classe III. Ele é composto, basicamente, por três conjuntos:

- sensor eletrônico, capaz de quantificar os deslocamentos verticais entre o chassi e o eixo traseiro do veículo utilitário gerados pelo movimento do veículo;
- odômetro de precisão para medição da distância percorrida pelo equipamento durante o levantamento;
- quantificador de irregularidade, ou seja, calculador do quociente entre a distância percorrida horizontalmente e os deslocamentos verticais da suspensão totalizados a cada 200 m.

Nos trabalhos foram seguidos os procedimentos DNER PRO-182/90, que normaliza a Medição de Irregularidade de Superfície de Rodovias com Medidores Tipo Resposta e o DNER PRO-229/89 (Manutenção de Sistemas Medidores de Irregularidade).

A medição é feita por dois operadores, um motorista e um técnico, fazendo-se o veículo percorrer o trecho a ser medido, sobre as trilhas de roda, a uma das seguintes velocidades:

- 80 ± 2 km/h;
- 50 ± 2 km/h;
- 30 ± 2 km/h.

O sistema conta com um programa para automatizar a aquisição de dados do integrador *Bump Integrator*, chamados ROMDAS, que elimina qualquer tipo de erro proveniente de anotação ou digitação mal feita, uma vez que as informações do integrador são transmitidas diretamente a um computador de bordo. Este contém dispositivos de verificação de consistência dos dados captados, acusando qualquer mau funcionamento dos sensores, seja de distância - DMI - ou seja, do *Bump Integrator* - sensor de resposta do veículo às irregularidades da rodovia.

Ao introduzir as equações de calibração, são fornecidos os valores de QI ou IRI conforme o desejado. Ele acusa ainda com sinal sonoro se a velocidade preconizada está fora dos limites aceitáveis e, em caso de mudança brusca de velocidade, ele promove automaticamente a substituição das constantes de calibração da velocidade correspondente para as constantes da velocidade efetivamente observada no levantamento, resultando em uma maior acurácia aos dados obtidos.

O Anexo C (Tomo V) apresenta os valores de QI e IRI totalizados a cada 200m para todas as faixas de tráfego.

3. AVALIAÇÃO ESTRUTURAL

A avaliação estrutural de pavimentos através de processos não destrutivos compreende basicamente o estudo da deformabilidade elástica exteriorizada pelo conjunto estratificado pavimento - solo de fundação, quando solicitado por carga externa. O estudo da deformabilidade é feito auscultando-se o pavimento com deflectômetros ou deflectógrafos, obtendo-se a deflexão reversível máxima e sua dissipação no meio adjacente, definindo-se assim a linha de influência da bacia de deflexões.

Pode-se definir deflexão reversível ou recuperável como os deslocamentos verticais que surgem no pavimento quando este é submetido a esforços externos, de caráter transitório, ou seja, a estrutura retorna à sua configuração anterior quando cessa o esforço.

O estudo da deformabilidade é feito com o objetivo de se avaliar indiretamente a capacidade de carga da estrutura do pavimento, e permite ainda que sejam inferidas as grandezas fundamentais como módulos de resiliência/rigidez e coeficientes de *Poisson* das camadas constituintes, estabelecendo o estado tensional da estrutura a partir dos conceitos clássicos da Mecânica dos

Pavimentos, o que permite estimar a vida remanescente dos mesmos.

O levantamento deflectométrico foi realizado com o emprego do *Falling Weight Deflectometer Dynatest 8000 (FWD)*, que é um deflectômetro de impacto projetado para simular o efeito de cargas de roda em movimento. Isto é obtido pela queda de um conjunto de massas, a partir de alturas pré-fixadas, sobre um sistema de amortecedores de borracha, que transmitem a força aplicada a uma placa circular apoiada no pavimento, conforme é mostrado nas Figuras 3.1, 3.2 e 3.3.

Figura 3.1 - Bacia de Deflexões medida com o FWD.

Figura 3.2 - Leituras do deflectômetro de impacto *Falling Weight Deflectometer*.

Figura 3.3 - Vista do *Falling Weight Deflectometer Dynatest 8000 E*.

As deflexões com o equipamento FWD foram determinadas conforme procedimento DNER-PRO 273/96. Na execução dos ensaios, aplicou-se uma carga de cerca de 4.100 kgf em uma placa de 30 cm de diâmetro. Foram efetuadas leituras de deflexões no centro de aplicação da carga aplicada e em pontos localizados a distâncias de 20, 30, 45, 65, 90 e 120 cm do centro da carga, a partir de sensores instalados no equipamento.

Os ensaios foram executados a cada 80 m, nas faixas mais solicitadas. O Anexo D (Tomo VI – BR 116) e Anexo H (Tomo IX – BR 381) contém as planilhas com o levantamento das deflexões.
